

All the water bottles distributed are bio bottles of natural water of Sant'Anna source. Where there are no industrial plants in the vicinity, no cultivated fields or pastures, there is nothing but the uncontaminated landscape and the bubbling spring. This is what engendered the awareness of having an obligation of **social responsibility to the surrounding environment.**

This **bio bottle** is **sustainable** and **environmentally friendly**, being **used to make compost**. Though it is as sturdy as a traditional plastic bottle, this bio bottle is **highly biodegradable** and will decompose naturally in 80 days in ad hoc composting sites.

650 million of these bio bottles ensure a saving of 176,800 oil barrels, a quantity sufficient to heat a city with 520,000 inhabitants for a month, and reduce CO₂ emissions by a quantity corresponding to the emissions from a car going round the world 30,082 times.
